### Description

**Uncompromising quality for stills and movies**  
Stunning image quality, only possible from a full-frame sensor.

**Full-frame imaging in a compact body**  
Superior light collection means high-quality, low-noise images  
Bigger sensors create better images, and the 7C's full-frame sensor is much larger than the sensors in smartphones, compact digital cameras and similar-sized APS-C interchangeable-lens cameras. The resulting increased light collection allows for professional-quality images with reduced noise, and more retained detail in both shadows and highlights.

**Compact size, easy operation**  
The 7C was fashioned to be compact, lightweight and portable without compromising genuine full-frame camera performance. This goal was accomplished by developing new mechanical components, such as a space-saving shutter and optical stabilisation unit, along with layout and structural enhancements.

**Stunning images, even at fast shutter speeds and in dim light**  
The larger pixel sizes on the sensor allow for an increased signal-to-noise ratio, for beautiful images with more detail in textures and shadow areas. Noise reduction is particularly effective at the medium- and high-ISO sensitivities required for fast-moving or poorly lit subjects. Standard ISO100-51200 is extendable to ISO50-204800.

**Lenses to match your style**  
A vast E-mount lens line-up, from wide to telephoto, video and specialised  
Whether you're an amateur or a professional, a photographer or a movie creator, a diverse range of over 50 E-mount lenses is available to elevate your creativity. Compact full-frame lenses provide exceptional low-distortion images, even at wide focal lengths, and allow for beautiful image depth and bokeh.
